when the battery is dead or not available. This situation may simply require a larger force to be applied to the actuating device. A motor or accumulator may be designed to be smaller than for a conventional proportioning device because these elements do not replace, but only ~~complete~~ complement the operator's energy.

Replace the paragraph beginning at page 1, line 2⁸ with the following ⁷ ~~with the following~~ ^{DATA} 8/29

amended paragraph:

IDC-A4,AMD

When the ~~springy~~ circular plate 7 is stopped by the ~~springy~~ annular disk 8 or completely compressed spring 9 and the operator releases the actuating button 3 the piston 5 and actuating button 3 are moved back to their initial position by the biased spring 9. The driving motor 14 which is under no tension ~~readily runs along here~~ allows the move back to the initial position.
